01 PROFILE

I build software around the people who need to use it, then stay with the operational details that make it dependable. Through Technomancy IT, I turn incomplete client needs into applications, integrations and support systems. My background combines hands-on AI tooling with IBM enterprise operations, FRII NOC leadership and the everyday work of explaining technical problems to business owners.

02 EXPERIENCE

Founder / Product Engineer / Systems Lead · Technomancy IT LLC | Present

Own client delivery from the first unclear requirement through implementation and production support. Build authenticated integrations across Slack, Google Workspace, Atlassian and internal tools, keeping access boundaries explicit.

Develop an AI IT support platform that connects service work, customer records, scheduling, billing and infrastructure context. Pair TypeScript and PostgreSQL application work with the deployment, monitoring and support it needs to keep running.

Senior Systems Engineer / Datacenter Architect · Front Range Internet Inc. | 2015-2020

Ran the NOC, engineering escalations and recovery verification for hosted infrastructure. After several years at FRII, was trusted with sole systems-engineering responsibility for about a year during its ownership transition, with NOC first-line coverage continuing.

Built tools for NOC teams and hosting customers, developed hosted PHP/JavaScript services and replaced the billing system. Ran SOC 1 and SOC 2 audits, turning technical controls into procedures and evidence other people could use.

Systems / Software Engineer · Office Evolution | 2014-2015

Built centralized applications connecting CRM, provisioning, onboarding and service operations across locations. Turned work that crossed department boundaries into explicit shared workflows.

Worked with the CEO and CIO on operational needs and technical implementation, connecting business context to the systems teams used every day.

Network & Systems Engineer · PlumChoice / Everon | 2012-2014

Engineered and supported networks, systems and endpoints for managed-service clients, with remote monitoring and on-call troubleshooting. Worked directly with business owners and end users to understand what was getting in their way.

Built diagnostic and support tooling around recurring operational problems, giving technical work a repeatable path rather than starting over with each incident.

Infrastructure and Systems Focal · IBM | 2010-2012

Served as infrastructure focal for shared enterprise environments, coordinating changes and escalations across application, infrastructure, vendor and business teams.

Automated audit, backup and compliance workflows and managed virtualization test labs and hosted desktops, building an early foundation in repeatable operations and shared responsibility.

03 SELECTED WORK

AI support with business context · Technomancy IT · own practice

Built a client-facing support platform connecting tickets, CRM, scheduling, billing and infrastructure telemetry. Tenant-aware services keep each client’s context and access separate; indexed retrieval and evaluation paths make the underlying operational information useful to AI workflows.

Document workflows people can trust · ProofMark · completed client contribution

Designed a signing workflow connecting identity, documents, routing, audit history and integrations. Explicit security-sensitive state and fallback paths tie the interface to the work behind it, so a document process is more than a sequence of screens.

Automation with ongoing ownership · NuPrice · long-term client engagement | 2019–2021

Built and operated the full marketplace repricing application, from competitor-data ingestion and user-defined pricing rules to accounts, subscriptions and embedded support. Continued handling billing, customer support and technical operations rather than treating launch as the finish line.

Tools for the people on call · Front Range Internet Inc. | 2015–2020

Built operational tools for NOC teams and hosting/colocation customers while running engineering escalations. Combined monitoring, recovery verification and usable procedures so operators had a clearer path from a problem to a working service.

04 CAPABILITIES

TypeScript, JavaScript, React, Node.js and PostgreSQL · AI-assisted workflows, model integration, retrieval and structured outputs · MCP connectors, OAuth/OIDC and tenant-aware access controls · AWS, Docker, practical Python and Bash automation · Client discovery, operational tooling, runbooks and direct user support
